CHAPTER 11

NETWORK ADDRESS TRANSLATION UNTUK IPV4

Routing & Switching
11.1 NAT Operation
11.2 Configuring NAT
11.3 Troubleshooting NAT
11.4 Summary
CHAPTER 11: OBJECTIVES

• Describe NAT characteristics.
• Describe the benefits and drawbacks of NAT.
• Configure static NAT using the CLI.
• Configure dynamic NAT using the CLI.
• Configure PAT using the CLI.
• Configure port forwarding using the CLI.
• Configure NAT64.
• Use `show` commands to verify NAT operation.
11.1 NAT OPERATION
NAT CHARACTERISTICS

IPV4 PRIVATE ADDRESS SPACE

• IPv4 address space is not big enough to uniquely address all the devices that must be connected to the Internet.
• Network private addresses are described in RFC 1918 and are to be designed to be used within an organization or site only.
• Private addresses are not routed by Internet routers while public addresses are.
• Private addresses can alleviate IPv4 scarcity, but because they aren’t routed by Internet devices, they first need to be translated.
• NAT is process used to perform such translation.
APA ITU NAT?
APA TUJUAN NAT?
• Mengurangi keterbatasan IPv4
• Menyembunyikan skema network internal
TERMINOLOGI NAT

• Inside Local Address : source address sebelum translasi (IP Private)
• Outside Local Address : destination address sebelum translasi (IP Private)
• Inside Global Address : inside host setelah translasi (IP Public)
• Outside Global Address : outside destination host setelah translasi (IP Public)
### Private Internet addresses are defined in RFC 1918:

<table>
<thead>
<tr>
<th>Class</th>
<th>RFC 1918 Internal Address Range</th>
<th>CIDR Prefix</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>10.0.0.0 - 10.255.255.255</td>
<td>10.0.0.0/8</td>
</tr>
<tr>
<td>B</td>
<td>172.16.0.0 - 172.31.255.255</td>
<td>172.16.0.0/12</td>
</tr>
<tr>
<td>C</td>
<td>192.168.0.0 - 192.168.255.255</td>
<td>192.168.0.0/16</td>
</tr>
</tbody>
</table>
IP PRIVATE

• IP yang digunakan oleh organisasi secara internal dan tidak dapat dirutekan di internet.
• Perusahaan kecil biasanya mendapatkan IP Public dari ISP
• ISP Mendapatkan Alokasi IP Public dari IANA (internasional Assigned Numbers Authority)
• Device yang dapat melakukan translasi biasanya firewall, router, server
## IP PRIVATE

<table>
<thead>
<tr>
<th>Class</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>10.0.0.0 – 10.255.255.255</td>
</tr>
<tr>
<td>B</td>
<td>172.16.0.0 - 172.31.255.255</td>
</tr>
<tr>
<td>C</td>
<td>192.168.0.0 – 192.168.255.255</td>
</tr>
</tbody>
</table>
CARI HIERARKI ISP DI INDONESIA?
KEUNTUNGAN NAT

• Menghemat alamat IP secara legal
• Mengurangi overlap pengalamat
• Meningkatkan fleksibilitas ketika berkomunikasi ke internet
• Mengurangi penomoran kembali jika terjadi perubahan jaringan
KERUGIAN NAT

• Terdapat delay pada proses switching
• Tidak dapat melakukan trace end-to-end IP
• Terdapat beberapa aplikasi yang tidak berfungsi ketika implementasi NAT
TIPE NAT

- NAT Static
- NAT Dynamic
- PAT (Port Address Translation)
NAT STATIC

• Termasuk jenis one-to-one NAT, satu IP private ditranslate menjadi satu IP public.
• Ingat, untuk NAT static tiap host menggunakan IP public sendiri
• Bisa inisiasi komunikasi dari jaringan outside global
KONFIGURASI NAT STATIC

<td>209.165.201.1</td>
</tr>
</tbody>
</table>
Static NAT uses a one-to-one mapping of local and global addresses.

These mappings are configured by the network administrator and remain constant.

Static NAT is particularly useful when servers hosted in the inside network must be accessible from the outside network.

A network administrator can SSH to a server in the inside network by pointing the SSH client to the proper inside global address.

R2
TYPES OF NAT

DYNAMIC NAT

CONFIGURATION
DYNAMIC NAT

- Termasuk many-to-many NAT, dimana IP Private jumlah banyak kemudian ditranslasikan menjadi IP public dalam jumlah banyak juga dengan menyediakan sebuah pool IP public.
- Tidak perlu memerlukan translate satu per satu, cukup sediakan IP public sejumlah user yang terkoneksi ke internet.
<table>
<thead>
<tr>
<th>Private IP (ACL 1)</th>
<th>Public IP (Pool R1)</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Private IP (ACL 1)</th>
<th>Public IP (Pool R2)</th>
</tr>
</thead>
</table>
LANGKAH-LANGKAH

• Tentukan interface NAT inside
• Tentukan interface NAT outside
• Tentukan permit ACL Private Network
• Tentukan pool Public IP
• Buat translasi NAT dari source ACL ke destination pool Public IP
• Dynamic NAT uses a pool of public addresses and assigns them on a first-come, first-served basis.

• When an inside device requests access to an outside network, dynamic NAT assigns an available public IPv4 address from the pool.

• Dynamic NAT requires that enough public addresses are available to satisfy the total number of simultaneous user sessions.
CONFIGURATION
NAT DYNAMIC OVERLOAD (PAT)

- Tipe NAT yang paling populer
- Termasuk tipe many-to-one NAT
- Dengan menyediakan satu IP public dapat mentranslate IP private yang banyak dengan menggunakan pembeda yaitu port
- Disebut juga sebagai NAT Dynamic Overload, Port Address Translation (PAT), atau NAT Overload
### POOL NAT R1 DAN R2

<table>
<thead>
<tr>
<th>Private IP (ACL 1)</th>
<th>Public IP (Pool R1)</th>
</tr>
</thead>
<tbody>
<tr>

<td>12.12.12.11</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Private IP (ACL 1)</th>
<th>Public IP (Pool R2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.2.0/24</td>
<td>12.12.12.22</td>
</tr>
</tbody>
</table>
LANGKAH-LANGKAH

• Tentukan interface NAT inside
• Tentukan interface NAT outside
• Tentukan permit ACL Private Network
• Tentukan pool Public IP (terdiri dari single IP Public)
• Buat translasi NAT dari source ACL ke destination pool Public IP
Dynamic NAT uses a pool of public addresses and assigns them on a first-come, first-served basis.

When an inside device requests access to an outside network, dynamic NAT assigns an available public IPv4 address from the pool.

Dynamic NAT requires that enough public addresses are available to satisfy the total number of simultaneous user sessions.

  - PC3: 192.168.10.12

- **Outside**
  - R2
  - Internet
PORT ADDRESS TRANSLATION

- Port Address Translation (PAT) maps multiple private IPv4 addresses to a single public IPv4 address or a few addresses.
- PAT uses the pair source port and source IP address to keep track of what traffic belongs to what internal client.
- PAT is also known as NAT overload.
- By also using the port number, PAT forwards the response packets to the correct internal device.
- The PAT process also validates that the incoming packets were requested, thus adding a degree of security to the session.
TYPES OF NAT

COMPARING NAT AND PAT

• NAT translates IPv4 addresses on a 1:1 basis between private IPv4 addresses and public IPv4 addresses.

• PAT modifies both the address and the port number.

• NAT forwards incoming packets to their inside destination by referring to the incoming source IPv4 address provided by the host on the public network.

• With PAT, there is generally only one or a very few publicly exposed IPv4 addresses.

• PAT is able to translate protocols that do not use port numbers, such as ICMP; each one of these protocols is supported differently by PAT.
BENEFITS OF NAT

• Conserves the legally registered addressing scheme
• Increases the flexibility of connections to the public network
• Provides consistency for internal network addressing schemes
• Provides network security
BENEFITS OF NAT

DISADVANTAGES OF NAT

• Performance is degraded
• End-to-end functionality is degraded
• End-to-end IP traceability is lost
• Tunneling is more complicated
• Initiating TCP connections can be disrupted
8.2 CONFIGURING NAT
There are two basic tasks to perform when configuring static NAT translations:

• Create the mapping between the inside local and outside local addresses.

• Define which interfaces belong to the inside network and which belong to the outside network.
Example Static NAT Configuration

Establishes static translation between an inside local address and an inside global address.
R2(config)# ip nat inside source static 192.168.10.254 209.165.201.5

R2(config)# interface Serial0/0/0
R2(config-if)# ip address 10.1.1.2 255.255.255.252
Identifies interface serial 0/0/0 as an inside NAT interface.
R2(config-if)# ip nat inside
R2(config-if)# exit

R2(config)# interface Serial0/1/0
R2(config-if)# ip address 209.165.200.225 255.255.255.254
Identifies interface serial 0/1/0 as the outside NAT interface.
R2(config-if)# ip nat outside
CONFIGURING STATIC NAT

ANALYZING STATIC NAT

NAT Table

<table>
<thead>
<tr>
<th>Inside Local Address</th>
<th>Inside Global Address</th>
<th>Outside Global Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.10.254</td>
<td>209.165.201.5</td>
<td>209.165.200.254</td>
</tr>
</tbody>
</table>
The static translation is always present in the NAT table.

```
R2# show ip nat translations
Pro Inside global  Inside local  Outside local  Outside global
---  209.165.201.5  192.168.10.254  ---  ---
R2#
```

The static translation during an active session.

```
R2# show ip nat translations
Pro Inside global  Inside local  Outside local  Outside global
---  209.165.201.5  192.168.10.254  209.165.200.254  209.165.200.254
R2#
```
CONFIGURING STATIC NAT

VERIFYING STATIC NAT (CONT.)

Peak translations: 2, occurred 00:00:14 ago
Outside interfaces:
  Serial0/1/0
Inside interfaces:
  Serial0/0/0
Hits: 5  Misses: 0
<output omitted>
CONFIGURING DYNAMIC NAT

DYNAMIC NAT OPERATION

• The pool of public IPv4 addresses (inside global address pool) is available to any device on the inside network on a first-come, first-served basis.

• With dynamic NAT, a single inside address is translated to a single outside address.

• The pool must be large enough to accommodate all inside devices.

• A device is unable to communicate to any external networks if no addresses are available in the pool.
# Configuring Dynamic NAT

## Dynamic NAT Configuration Steps

<table>
<thead>
<tr>
<th>Step</th>

R2#
Define a pool of public IPv4 addresses under the pool name NAT-POOL2.
R2(config)# ip nat pool NAT-POOL2 209.165.200.226
       209.165.200.240 netmask 255.255.255.224
Define which addresses are eligible to be translated.
R2(config)# access-list 1 permit 192.168.0.0 0.0.255.255
Bind NAT-POOL2 with ACL 1.
R2(config)# ip nat inside source list 1 pool NAT-POOL2
overload

Identify interface serial 0/0/0 as an inside NAT interface.
R2(config)# interface Serial0/0/0
R2(config-if)# ip nat inside

Identify interface serial 0/1/0 as the outside NAT interface.
R2(config)# interface Serial0/1/0
R2(config-if)# ip nat outside
### CONFIGURING PAT: SINGLE ADDRESS

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| Step 1 | Define a standard access list permitting the addresses that should be translated.  
  ```
  access-list access-list-number permit source [source-wildcard]
  ``` |
| Step 2 | Establish dynamic source translation, specifying the ACL, exit interface and overload options.  
  ```
  ip nat inside source list access-list-number  
  interface type number overload
  ``` |
| Step 3 | Identify the inside interface.  
  ```
  interface type number  
  ip nat inside
  ``` |
| Step 4 | Identify the outside interface.  
  ```
  interface type number  
  ip nat outside
  ``` |

R2# `show ip nat translations`
Port forwarding is the act of forwarding a network port from one network node to another.

A packet sent to the public IP address and port of a router can be forwarded to a private IP address and port in the inside network.

Port forwarding is helpful in situations where servers have private addresses, not reachable from the outside networks.
Port Forwarding on a SOHO Router

192.168.1.254

http://www.example.com
In IOS, Port forwarding is essentially a static NAT translation with a specified TCP or UDP port number.

```
Establishes static translation between an inside local address and local port and an inside global address and global port.
R2(config)# ip nat inside source static tcp 192.168.10.254 80 209.165.200.225 8080

Identifies interface serial 0/0/0 as an inside NAT interface.
R2(config)# interface Serial0/0/0
R2(config-if)# ip nat inside

Identifies interface serial 0/1/0 as the outside NAT interface.
R2(config)# interface Serial0/1/0
R2(config-if)# ip nat outside
```
NAT is a workaround for IPv4 address scarcity.

IPv6 with a 128-bit address provides 340 undecillion addresses.

Address space is not an issue for IPv6.

IPv6 makes IPv4 public-private NAT unnecessary by design; however, IPv6 does implement a form of private addresses, and it is implemented differently than they are for IPv4.
IPV6 UNIQUE LOCAL ADDRESSES

• IPv6 unique local addresses (ULAs) are designed to allow IPv6 communications within a local site.

• ULAs are not meant to provide additional IPv6 address space.

• ULAs have the prefix FC00::/7, which results in a first hextet range of FC00 to FDFF.

• ULAs are also known as local IPv6 addresses (not to be confused with IPv6 link-local addresses).
• IPv6 also uses NAT, but in a much different context.
• In IPv6, NAT is used to provide transparent communication between IPv6 and IPv4.
• NAT64 is not intended to be a permanent solution; it is meant to be a transition mechanism.
• Network Address Translation-Protocol Translation (NAT-PT) was another NAT-based transition mechanism for IPv6, but is now deprecated by IETF.
• NAT64 is now recommended.

CHAPTER 11: SUMMARY

This chapter has outlined:

• How NAT is used to help alleviate the depletion of the IPv4 address space.

• NAT conserves public address space and saves considerable administrative overhead in managing adds, moves, and changes.

• NAT for IPv4, including:
  • NAT characteristics, terminology, and general operations
  • Different types of NAT, including static NAT, dynamic NAT, and NAT with overloading
  • Benefits and disadvantages of NAT

• The configuration, verification, and analysis of static NAT, dynamic NAT, and NAT with overloading.
• How port forwarding can be used to access an internal devices from the Internet.
• Troubleshooting NAT using `show` and `debug` commands.
• How NAT for IPv6 is used to translate between IPv6 addresses and IPv4 addresses.
TERIMA KASIH
